

What are the advantages of Junglefy

- Environmentally sound. Our system is constructed from post industrial recycled plastic and is fully recyclable. The green wall system employs organic growing media which is a by-product of the organic food industry. At the end of its lifecycle it can be used directly as garden mulch.
- Advanced modular design. Junglefy green wall product has arisen from a company that has vast experience in the construction and maintenance of green walls and is aware of the many deficiencies of the existing systems. These deficiencies have been built out, by clever design and engineering. The design is lighter, easier, quicker, better, smarter.
- Aesthetic Advantages - Junglefy has responded to wishes of architects and designers in the design process of the green wall. This has resulted in a system that lends itself to being grown on site as the aesthetics of the bare modules are not visually offensive as in other modular systems. Growing offsite adds expense to the installation of green wall. Now you have options!
- Innovative - Junglefy green wall system has a companion fascia system where architects and designers can integrate a green wall into a design theme and even create green walls into green logos and green wall motifs and other organic or geometric shapes this potential is unique to this system.
- Cost effective - Junglefy green wall system is the most efficient system to install. These efficiencies result in better value for money in installation, and overall costs per square metre, even considering all its other advantages over other systems.
